PROFESSIONAL SUMMARY

Computer Science graduate from Arizona State University with practical experience in AI/ML systems, computer vision, LLM applications, and distributed data pipelines. Developed projects involving transformer-based models as well as containerized streaming architectures using Docker, Kubernetes, and Kafka. Seeking to build scalable AI-powered software and agentic solutions.

EDUCATION

ARIZONA STATE UNIVERSITY **May 2026**
- M.S. in Computer Science

FENG CHIA UNIVERSITY, Taiwan **Jun. 2023**
- B.S. in Information Engineering and Computer Science

TECHNICAL SKILLS

- **Programming:** Python, Java, JavaScript, C, C++, SQL
- **AI / ML:** PyTorch, Transformers, Deep Learning, Computer Vision, TimeSformer, Scikit-learn
- **LLM & AI API:** OpenAI API, Gemini API, Claude API, Prompt Engineering
- **Libraries:** MediaPipe, OpenCV, Selenium
- **Data & Databases:** NumPy, pandas, Neo4j, SQL
- **System & Infrastructure:** Docker, Kubernetes, Kafka, Linux
- **Tools & Platforms:** Git, GitHub

EXPERIENCE

AI Researcher (Volunteer) | Arizona State University **Sep. 2026 - Present**
- Developing an LLM-based legal fact canonicalization pipeline using semantic embeddings and equivalence adjudication to identify recurring fact patterns
- Exploring embedding-based retrieval, clustering, and structured LLM evaluation methods for extracting and organizing knowledge from legal cases

ACADEMIC PROJECTS

Distributed Streaming Data Platform for Real-Time Graph Analytics **Fall 2025**
- Designed and deployed a containerized (Docker) distributed data pipeline using Kafka, Zookeeper, and Neo4j on Kubernetes for scalable real-time data ingestion
- Integrated Kafka Connect with Neo4j and configured container networking and services to support streaming graph analytics on the NYC Taxi dataset

A Robotic Hand Simulator for American Sign Language Recognition **Spring 2025**
- Developed an American Sign Language recognition system using PyTorch and transformer-based video models on the WLASL2000 dataset containing over **2,000** sign classes and **21,000+** videos
- Optimized TimeSformer model via hyperparameter tuning, achieving **91.73%** Top-1 accuracy, and integrated MediaPipe for real-time ASL phrase visualization

LLM-based Structured Data Generation from Unstructured Sports Reports **Spring 2025**
- Developed Python scraper code using Selenium to collect play-by-play scripts and ground truth tables from ESPN for **800** MLB games
- Experimented with various prompts and system instructions for Gemini LLM to generate statistical tables; evaluated with RMSE and ACC
